

Why choose Chemistry A Level?

Every time we light a match, boil an egg or simply breathe in and out, we perform a chemical reaction. Our bodies grow, develop and function entirely as a result of the chemical processes that go on within them. Most of the food we eat is grown with the help of chemical fertilisers and kept from rotting with chemical preservatives. If these issues interest you, you will enjoy studying Chemistry at A Level.

What will I study?

As the science of substances, studying Chemistry will give you a deeper understanding of the natural world. You will learn more about the underlying nature of our world and develop your logic and problem-solving skills. You will also develop key practical and analytical skills in the laboratory.

What career and university options can it lead to?

Studying Chemistry can open the door to a wealth of degree and career options, including courses in Medicine, Veterinary Science, Dentistry, Pharmacy, Chemical Engineering, Forensic Science, Aeronautics, Mechanical and Electronic Engineering.
